Hi Daniel,

From this thread it is not apparent to me what the situation is now.

So far as I can tell, `Get(int r,int c)` gets the value at the currently displayed row and column.  
Presumably, `Set(int r,int c,Value v)` sets the value at the currently displayed row and column.

What I would like is if you could add a `SetUnsorted(int r,int c,Value v)` and `GetUnsorted(int r,int c)` or whatever names they should go by. These functions would access the data by their original row and column.

Thanks,

Nick
