It is my misundertand, or there is a bug in the XmlNode object?

Short example:

```
XmlNode pr;  
pr.GetAdd("Project").GetAdd("Application").GetAdd("Init").GetAdd("Is").At(0).CreateText(AsString(  
(int)gIntSlot));
```

This code will create the text for the node named "Is", but in fact I must create a sub node using
.At(0)...

What I don't understand is why the most intuitive way:

```
XmlNode pr;  
pr.GetAdd("Project").GetAdd("Application").GetAdd("Init").GetAdd("Is").CreateText(AsString((int)gI  
ntSlot));
```

Don't create the text for the correct node in the chain?
