hi all..

just tonight i started trying umk for myself. can't believe i've been away for so long

i use a setup, where all my ide config lies in V:\upprun, then there is U:\uppsvn and V:\uppgit for known reasons.. to keep the code separated from the runtime stuff..

so i copied the umk.exe in V:\upprun and started with

umk examples_git Bombs MSC9 -b +GUI,SHARED bombs.exe

it did some things, but stopped eventually stopped at the same Invalid build method message, because it could not find my MSC9.bm, lying in the same folder.

so i debugged a bit: why not simply adding the current umk.exe to the search path..that worked for me and i think would do for many..
