but it's good to see that except for that umk works just as fine on windows too..even on my more or less 'non standard' upp environment setup

BTW:

just plain realized yesterday night, how neat the upp build system is with the package/assembly approach..eclipse is versatile, but i couldn't figure out how to add extern libraries (or at least their dependency) to a static library project of Core. so my final rference/Core01 project, as user of Core static lib, had to link all the libraries Core dependency libraries. (kernel32, etc..).

here, umk is a very good choice, handling all those dependencies in such a 'logical' way.

cheers
