
Subject: Why not drop ParentCtrl pane and add Ctrls directly to TabBarCtrl?

Is there a special reason for having a separate pane in TabBarCtrl? to group them? To only modify pane Rect on Layout()?

I modified my TabBarCtrl implementation and it seems to work..

i do SetRect(GetClientArea()) to all Ctrls in ctrls..

Am I forgetting sth?

The point behind it: make TabBar simpler in hierarchy, maybe even having manage adding/removing to/from ctrls in the ChildAdded() / ChildRemoved()?

EDIT: attached the patch file to show what i'm talking about
