Hi,

I want to pass as a parameter a few tabs.
It is all about some code neatness. I can do it inside the constructor but it is too much code there
acoording to my standards

What type are they?
I was looking through the library and could not figure it out.

I thought they might be Tabs but after that I noticed that was a private struct.

Here is what I am trying to achieve.

```
WithAdminRegNewUserLayout<ParentCtrl> tab1;
WithAdminDeleteUserLayout<ParentCtrl> tab2;
WithAdminCreateUserRoleLayout<ParentCtrl> tab3;

adminDlg (tab1, "User Registration")
 (tab2, "User Deactivation")
 tab3, "Create Role")
.Title("Admin's Workspace")
.Sizeable()
.Zoomable();

hideAttributes(tab1);
adminDlg.Execute();

}

void Admin::hideAttributes(???Tabs??? tab){
  //hide the lables in the CreateUser Tab
  tab.newGenID.Hide();
  tab.newGenLable.Hide();
  tab.newGenPass.Hide();
```

Thank you very much for your help.
