Subject: List of custom controls, how?

Hello devs, I have been busy with a movie managing program for myself. The idea is that you can configure multiple directories containing movies that will be loaded into a library (list that loads all information about them). I also have a functionality that grabs IMDb information. It currently looks as shown below.

Now the links you see in the IMDb section are testing links. These are links found in a search operation. However, I would like these links to be displayed in a custom control. The way I would like to have it is as following.

I have some experience with C# so I know a thing or two about custom controls. However, I am not using the designer with layouts because I use Visual Studio aside of U++ for debugging purposes.

- I know I have to make a new class deriving from (Ctrl)?
- I have to override the Paint(Draw& g) method
- I have to draw a rectangle inside the paint method in which the contents of my custom control will be drawn.

I really don't know how this would work. I have tried to find out the things I need to know but it is hard to find. Can somebody supply me with an example of how it works or how they would do this? I really appreciate your help!
