Hy all,

I am currently trying to build thelde on a gumstix (linux overo + ARM cortex A8) board.

I'm almost done but I stumbled on the Xi lib which the linker says it can't find although it's present in /usr/X11R6/lib.

So I tried to compile thelDe on my Fedora computer while having previously removed the Xi lib from CtrlCore ... and thelde compiled and linked perfectly.

==> so is this lib really needed ???

NB: I will post the procedure to use upp on gumstix once finished but it's almost straight forward (once you have all the libs installed of coarse ...)
