Hello koldo,

Many thanks for that piece of code. I will much prefer to use the U++ function, as it looks cross platform. however i have tried "FileMove" instead of "MoveFile" API. But the result is still the same error 123. After all FileMove is also calling "MoveFile" API at the end. I feel the problem is out of my deapth. I know there is something strange is going on when the filenames are fetched from LineEdit Ctrl. And I can not think of any wasys to investigate the inside the String. If I prints out the string on LineEdit Ctrl again, they visually looks normal. But my hunch is, its something to do with hidden chars or char codes.
