lectus wrote on Tue, 27 November 2012 09:29I use Virtualbox a lot to test Linux distros.

But some people say VMWARE Player (also free for personal use) has better performance.

What would be the best one for running multiple OSes and building U++ software? What's your experience?

I am using VMWARE player because I had strange issues with VirtualBox - e.g. it was strangely slowing down to the point of freeze during compilation. Nothing like that experienced with VMWARE...
