Zbych wrote on Thu, 29 November 2012 10:37I have one more question for you.

I have a drop list and want to preselect one value from it.

Right now I create a map ("Item1", "0")("Item2", "1")("Item3", "0"), pass it to witz and use \$if to preselect position.

```
<select name="MyList">
  $for(i in MYLIST)
    $if ( i != 0 )
      <option value="$i._key" selected="selected">$i._key</option>
    $else
      <option value="$i._key">$i._key</option>
  $/
$/  

```

</select>I'm not aware of any other simple way, I do it like this too. Only alternative I know about is sending MYLIST as an array of arrays/maps of two field, where the second contains the "selected=\"selected\" or empty string, so it can be included in single pass, without \$if. But it seems to me even worse, because it pushes html code into app

Zbych wrote on Thu, 29 November 2012 10:37Is there a shorter way (without \$if)? Maybe something similar to c?

```
$for(i in MYLIST)
  <option value="$i._key" $(i != 0) ? selected="selected" : "">$i._key</option>
$/I believe (can't test right now) you can inline the $if:$for(i in MYLIST)
  <option value="$i._key" $if(i != 0) selected="selected" $/>$i._key</option>
$/  

```
