How do you change the EditFields content from different header file?

In java it is something like this to get access:

Server srv = new Server(11811);

TrackLayer tlayer = new TrackLayer(wwd);

I have several apps created using U++ and combined them.

There is about 2300 lines of code plus 5 header files that takes and returns data.

I would like to be able to change the data in the EditFields from header files.

I thought it might be easier if the GUI was in a header file.

Here is a test app that only has one EditField in H1.h but cannot change the data from H2.h
