I have create my own Live Updater package in Windows environment. This package use either FTP, HTTP or LAN to update the application. I have test it on Windows 7 machine with CentOS server. However, I have no Linux work station on hand that I can't debug the package for Linux. Is there anyone can help to test the package ?

The package is attached. Package Reference and Usage is inside the package. Modification and helps are welcome. Thank you.

P.S. If you are using Windows, please feel free to use this package. I have install 2 applications in my client site with success in Windows machines.
