crydev wrote on Thu, 06 December 2012 11:33I have a splitter which contains an arrayctrl on the left side. Now I would like to place a custom ctrl with a fixed height(not resizable) above the arrayctrl. Say the custom ctrl has a height of 100, and the arrayctrl takes the rest. When I resize the window, the arrayctrl should be resized, and the custom ctrl should remain its height. In .NET this is the standard control docking. However, I looked over the U++ docking component, but this clearly is not what I am looking for. I also took a look at SetMin function of Splitter, but there is no SetMax equivalent that could suit my needs.

How should I solve this?

Hi crydev,

You can use ParentCtrl to achieve both having multiple Ctrl's in one splitter cell and having them independently sized. Here is a simple example:`#include <CtrlLib/CtrlLib.h>`

```
using namespace Upp;
```

```
struct App : TopWindow {
    Splitter s;
    Button b;
    LineEdit e;
    ParentCtrl p;

    App() {
        b.SetLabel("some button");
        p.Add(b.HSizePos().TopPosZ(0,30));
        s.Vert(p, e);
        Add(s.SizePos());
    }
};
```

```
GUI_APP_MAIN {
    App().Run();
}
```

Best regards,
Honza
