Subject: Socket Communication 101

Hi,

I need to figure out sockets.
And I have no much knowledge in that.

I run the reference examples and the communication works great and I understood what is going on both sides.

However, I still cannot imagine/assimilate how to transfer large chunks of data.

For example:
If a query to a database is returning an array of data how do I send it to the client side as one chunk?
Also how can I lable/mark that chunk to which class in my application is the receiver?

I already and I assume, but not sure, I can send an array with RawSend/RawRecv, then shoud I initialize/end RawOpen/RawClose the connection in a specific way?

Thank you very much.

Best,
Georgi

P.S. Please let me know if I should try to clarify myself.
