Hi Honza,

Thanks for your reply... and more especially for your very nice script

As I am very very lazy, I used it to find the problem. And in a few seconds, I was able to see that no only there is a circular call between CtrlLib and CtrlCore, but that there is the same circular call with the AddressBook example !

As I never had this warning before, I suppose that it's just a problem with the 5648 version that I'm using and try to download the last nightly build.

Thanks again !

PS : Here is the package dependencies of AddressBook made with your script. We see well the circular dependency between CtrlLib and CtrlCore
