jibe wrote on Sat, 22 December 2012 15:17Hi,

A good and easy solution is Proxmox. And it's open source (GPL) !

Actually, Proxmox is just a nice-looking wrapper around OpenVZ and KVM. It could be useful, but it is definitely far from what OP asked about - Proxmox doesn't run from Windows, it is basically a linux distro (so you'd have to virtualize windows in it).

Honza
