Hi Mirek,

It was Linux that I was having trouble with. Web does not appear to be available in Linux.

I took your advice and updated HttpClient to HttpRequest. However, I get the following error

socket(720) / StartSSL: Missing SSL support (Core/SSL)

when submitting a request like the following

[actually will pm you an example as dont want bots pinging my licence server]

which is what I need in order to get my licencing working. I have tried activating SSL using SSL()  
but same result.

Any ideas?

Nick

p.s. my point about including sysinfo in core is that then we could use it without having to worry  
about Functions4U becoming incompatible as it does from time to time.
