For the last piece of code you posted: You probably want the inserting into TEAMROUND to be done in single query too. You now know how, so it should be easy.

I tried but I am afraid this time it can't be done. In fact I am inserting in two tables (TEAMROUND and PLAYERROUND) and in the second one I need the 'id' of the record just inserted in the first table that is unknown before of query (or maybe yes). So, after the query I get it by

```
int idTEAMROUND = SQL.GetInsertedId();
```

and then use it later in the final query.
