CppMod wrote on Fri, 04 January 2013 21:24 The problem seems to be intermittent. For a while, it seemed that I would get it back by re-starting TheIDE. Sometimes it would work on some classes, and not on others -- then mysteriously start working on the classes that weren't formerly working.

This is typically caused by syntactic errors in the edited file. They some time confuse the parser and it results in autocompletion working only in the part of the files before the parsing failed. Easiest way to fix that is to check and correct the errors if there are some...

Of course, it can be something else as well. The C++ parsing is quite complex task and it's possible there are still some bugs...

Best regards,
Honza
