forlano wrote on Tue, 04 July 2006 09:19Hello,

when I build my application under Ubuntu (BLITZ + Shared libs)theIDE automatically use libstdc++6 although I've also libstdc++5. Some users using Suse and libstdc++5 report to be not able to run the program. They suggested me to link against the old libstdc++5 to increase the portability. How to do it? (Please consider that Blitz + All static option doesn't work and the only build method that works is BLITZ + Shared libs).

Thank you,
Luigi

Another solution is maybe to link statically the libstdc++6. But how to tell to theIDE to perform this task? Any idea?

Luigi
