I think currently I'm not advanced enough to add anything to U++ myself I have another question though. Is it possible to pass Http parameter of Skylark handler by reference to another function called from that handler and use it there?

I'd like to write a wrapper function inside which I'd be able to access shared variable space and session variables:

```
SKYLARK(SomeHandler, "somepath")
{
    wrapper(http);
}
```

```
void wrapper(Http& http)
{
    // can I access http passed from SomeHandler here?
}
```

Is the above safe/guaranteed to work? Can I access variables associated with http object from within wrapper?
