Thanks Mirek,

I was wondering about that. I deliberately split file format from data objects in openWind and so a TIFF specific solution would not be desirable. My users tend to have lots of RAM so speed is more important.

However, it would be good if I could compress on saving. Then again the best solution would be to compress the entire workbook as it is saved and decompress on reload.

I should be back home in Canada next week and will email you and Koldo about this and other issues then.

Thanks again (I think this is might be my first direct contribution to UPP code - it's taken me a while)

Nick
