I have not read into details, but it looks like you are comparing CUPS generated PDF with U++ generated one. If that is so, then our methodology differs: What I have done is to print the report on real printer, then export PDF and print it on the same printer too. Results look identical (maybe there is some small offset).

Mirek

I think I understand. That's a problem for me.

My application should be able to create PDF documents AND prints that comply with DIN 5008. This is a industry norm here in germany, which contains a lot of rules defining where what has to be placed on a document. Have a look at the images on <http://www.pt-mediengestaltung.de/thema.html> - they show quite a lot of these placements that have to be hit precisely.

Currently I don't see a way to comply with that norm using reports and QTF. So I guess I have to reinvent the wheel, adding this functionality. This will be tough for me as a newbie with U++.. I hoped there was a workaround or a way to reach something that is at least close using reports and applying fixed margins and page size. As far as I understand now, this is not possible, right?

I hope you might help me again when I have questions during my tries to implement this stuff..

Thanks again!

Kind regards,

frozen
