Subject: Format 1234567.89 as 1,234,567.89

In examples, there is a package called Format which demonstrates some typical use of Format, where:

Format("%nl",1234567.89);

would generate the desired format.

However, the above produces a very different result when GUI is defined. Is it because of a bug in Core, or there is a more reliable and consistant format string for that purpose?

Thanks,

Lance
