
Subject: Compiling a U++ project with a Python API on Windows

Hi all,

I'm new to U++ and rather new to the kind of compilation tricks I am trying to pull off here, so I'm hoping this is obvious stuff...

I would like to access a U++ codebase from Python and was trying to do this using Boost.Python. I have done all the necessary installations of U++, the codebase and Boost and everything works independently. I can compile the code, I can work in U++ and I can create Python API's using Boost.

However, Python has distutils, Boost insists on bjam and U++ has its own compiling mechanism as well and that is where I run into trouble.

U++ does not create pyd files and it seems I can't get cl.exe or bjam.exe to include the necessary U++ libraries; I am getting lots of errors like:

```
main.cpp(124) : error C2228: left of '.Run' must have class/struct/union
           type is "unknown-type"
main.cpp(124) : error C3861: 'Thread': identifier not found
```

So, does anyone know of a way to do one of the following:

- compile a U++ project using the Visual Studio command line
 - include Boost.Python in U++ and get it to spit out pyd file or an equivalent
 - create a Python interface on a U++ project without involving Boost.Python
- (or should I just move everything to Linux and will everything go smoother there?)

Thanks a lot for any pointers!

Dirk
