Hello,

a user of mine (using Windows 7) reported a strange problem.
His (my) program create a sqlite db but after some operation the db become read only type and no modifications were possible.

I tried to open and modify the data with the tool sqliteadmin but the data cannot be changed (it is read only as said).

It looks very strange. Does anybody met such case? What can be happened to turn a writable db in readonly mode?

Thanks,
Luigi

edit: the operative system was Vista
