Your info got me searching around and :
Well it turns out that it's a nasty dependency problem,
Upp is not installed.
It was probably removed with the apt-get -f install .
Maybe I just have the wrong version of upp for squeeze,
So I tried adding the nightly build repository and it worked,
but then this comes up.

upp:
Depends: libgtk2.0-dev but it is not going to be installed
Depends: libnotify-dev but it is not going to be installed

So maybe somebody already asked about this,
However I will never again wake a thread from the dead.
it might come and hound me.
Or maybe you know how to solve this.
But first I need some sleep.
Or it might be necessary to wake me from the dead.
I have been working hard today.

Greetings and thanks for the info so far.
