Thanks Sender Ghost for the information.

edit: At first it seemed too easy but I was still on Win.  
I tried the `Ctrl::NoLayoutZoom()`; and the size is still different.

I understand the user setting of DPI can make a difference but the above image is one screen shot in Ubuntu with the app running from Thelde and the app from Win running under wine at the same time, one is just moved below the other.

I think when installing or maybe later all the M\$ fonts are installed in Ubuntu. They sure look the same except the size but the dot above the i is higher. I didn't try the `Draw::SetStdFont(fnt)`; but maybe that will be necessary.
