Hi Koldo

Thanks, this is very close to what I want

How do I ensure that there is just one point at each X? Is there a function to find a point with `x==index` and replace that with a value?

What I am looking for is something like

```
if (Find(Series, Pointx.a==Index))
    // replace the point
    Series.Set(Index, PointNew);
else
    // add to the series
    Series << PointNew;
```

I'm sorry if this is very elementary. I haven't reached that far yet in C++.

Regards
Jerson
