Subject: Program loses hover focus

Hello all,

Over the past couple of years (don't worry, not fulltime ) I have built a program with a lot of tabs, a lot of windows and even more functionality. The program focuses on keeping track of pupils, tests and generating plotter graphs and reports.

The program is maturing more and more and has already seen an alpha release to a small group of 25 users. I am currently fixing the first set of bugs and adding some feature requests. I could really use some help with one of the bugs!

During a certain procedure I remove tabs from a TabCtrl and add new ones (using layout files), after which normal procedures should resume. However, then I have lost hover focus on my controls and menus. I can click a DropDownList for example, but can not activate its options with the mouse. It is fixed as soon as I minimize the program and maximize it again.

Does this ring a bell with anyone: is there a function I should/could call after moving/adding the tabs which I am forgetting about?

If not, I will try to distill a small enough test case next week to put here.
