I guess you are right.

Hopefully fixed.

Mirek

Thank you! It is fixed.

There is another issue, well, this is not a problem, that I can see in the new version of Docking: you cannot dock two floating windows into each other. You have to dock first floating window into the main window, and only after that you can dock another floating window into it. You can undock a bunch of tabified windows, after that you can undock individual tabified windows, but you cannot restore previous state by creating a floating windows with tabs. This is easily reproducible with DockingExample1.

Thanks.
