Hello,

It seems that, there are two docking packages one from bazaar and one from uppsrc. Personally, I think that we should remove three following packages from bazaar: "Docking", "DockingExample1" and "DockingExample2". Two independent packages for docking contributes to unnecessary chaos. At the end, I would like to notice that "Docking" from uppsrc compiles, but "Dokcing" from bazaar dosen't.

Guys, Can you try compile packages from "reference" assembly (DockingExample1 & DockingExample2)?

Sincerely,
Klugier
