PS: I skipped the most obvious option: Running your own server. But judging by the question, I decided it is not really what you'd like to hear

Thanks for your answer!

Yeah, running my own server is ok when building an intranet application. For example: providing Desktop and WEB versions of the same U++ application.

But my question was more for a website type of application which requires a dedicated hosting service.

Thanks for pointing out Openshift. I like their free plan for learning.
I look forward your tutorial on hosting Skylark app.
