Sorry my English,  
i'm created simple example to put some external opened Window in frame of TopWindow with DHCtrl and have a trouble:

```
GUI_APP_MAIN
{
    'this is for emulate of "some external opened Window"
    TopWindow child;
    Label b;
    child.Add(b.SetLabel("Hello!").LeftPosZ(10, 100).TopPosZ(10, 10));

    TopWindow main;
    SplitterFrame sf;
    #if 0
        //in top left of main we get "Hello!"
        main.AddFrame(sf.Left(child, 100));
    #else
        //trying to achieve the same as above result with DHCtrl
        DHCtrl wrap;
        child.Open();

        wrap.NcCreate(child.GetHWND());

        //probably do not need to do. I'm missing something, when...
        child.Hide();

        main.AddFrame(sf.Left(wrap, 100));

        //...the result is white left frame without "Hello!"
    #endif
    main.Run();
}
```
