Hello crydev,

You should definitely use LeftDown method instead of LeftUp. Here is exemplary code from my private control (LinkCtrl):

```
void LinkCtrl::LeftDown (Point p, dword keyflags) {  
    for (int i = 0; i < linkFields.GetCount (); i++) {  
        if (p.x >= linkFields[i].left && p.x <= linkFields[i].right) {  
            if (p.y >= linkFields[i].top && p.y <= linkFields[i].bottom) {  
                if (!WhenLink.Empty ()) {  
                    overrideCursor = false;  
                    WhenLink ();  
                    overrideCursor = true;  
                }  
            }  
        }  
    }  
  
    return;  
}
```

I am not sure that Label supports such functionality. But, you can always implement HyperlinkCtrl by your own. If you want to open web browser with specific url try following function:

LaunchWebBrowser(const String& url)

Sincerely,  
Klugier
