Greetings

I have attached my project with which I cannot seem to access the DLL as the program crashes when I try accessing it. LNPUBLIC makes it worse as it won't compile then.

The class I am interested in is called the PP_ComLib_WrapperClass which is within the DLL called PP_ComLib_Wrapper.dll At this moment, I have tried a lot of things and reached the point of frustration. Can someone please nudge me in the right direction with this?

The least I would like to do is access the Version() export so that I can make it work.

I have a C++ solution that works, but, I cant figure out how to port it to UPP. Any help with this appreciated.

Regards

Jerson
