I am yet working on subpixel issue, but the reason for violet is both apparent and weird: The problem is in .iml itself. If you edit .iml, you will see that it displays it violet over white too. Apparently, there is something wrong with that color. If you replace that with 'proper green with alpha', violet issue disappears.

In order to track the issue (which quite likely is in IconDes), may I ask how you have created that Image?
