Hello.

crydev wrote on Sun, 22 December 2013 23:21I figured that using the underlying ArrayCtrl maybe it was possible to mangle the displayed values the way I want. However, it doesn't work. Why doesn't it? Is there a way it will work?
It doesn't work, because PopUpTable already have added column for DropList. Moreover, the DropList uses keys for values based on Index<Value> container, which adds memory consumption in your case.

To solve this, I created VirtualDropList class based on DropList methods and following example, which you could find in attachments:
