Hello slashupp,

Quote:

well, it compiled and runs .. but only shows an empty package/assembly selector

Did you copy "ide" to directory where TheIDE was installed before (or move it to directory where it should be after standard compilation process). If it doesn't help just configure ide one more time.

Quote:

(this feels like it's getting messy - is there a better way in which I can setup a no-gtk theide where it creates what it needs by itself?)

I think, we should think about adding configuration script to POSIX Ultimate++ distribution. BTW standard makefile has got one important limitation it uses only one core. Configure file will enable us getting rid of this limitation.

\*\*\*\*\*

P.S. (Very important!!!)

Make sure that binary file calls "theide" insted of "ide".

Sincerely,  
Klugier
