I didn't actually read all the way through your post, I noticed this:

```
sql * Insert(TABLE)(C0, "a")(C1, 1)(C3, 2)
if(duplicate())
  sql * Update(TABLE)(C0, "a")(C1, 1)(C3, 2)
```

In sqlite, at least, you can use "REPLACE" to insert or update. According the the sqlite documentation, it's also in mysql:

[http://www.sqlite.org/lang\\_replace.html](http://www.sqlite.org/lang_replace.html)

Perhaps that should be added to the sql interface.

=)
