I all
I need to get text/caption of all controls of an external windows GUI app...

I dont know where to start...

I read about accessible pointer to specific window application using:

pi_acc_root_win)

Also I read that we can get the name/caption of the window using:
hr = pi_acc_root_win->get_accName(g_var_self, &str_name);

Then we have to get all childs using the same way but using a IDISPATCH interface type and then get the text of each child object, etc.

Any help/sample?

Thanks a lot

Alex
