@nneilson: touchy!? did you perhaps produce that heinous travesty?

In idefile.cpp [305] and Util.cpp [54 & 59] the extension '\$tmp' is already used.

A logical and \_consistent\_ continuation would be to use this extension elsewhere as well, or if that will clash, to at least use the '\$' character \_consistently\_ to indicate upp-private temporary files, e.g '\$xxx'.

Anyway, on Linux there is a /tmp directory for exactly these kind of files, or for persistent discardable data /var/tmp is available. To use them in this case would require a '#ifdef PLATFORM\_POSIX' ...?
