I were thinking of variadic templates in combination with variadic functions, so "more parameters" are not necessary since infinitely many are allowed. as for return value, I am not sure it can still be called callback when it's returning non-boolean value. the caller usually doesn't know who is being called. better use THISBACK for your own class and let the callback store some value inside of that class instead of returning it. but I agree some generic code doing that for global functions would be nice. new Templates4U project on bazaar?
