Where is the advantage to use Ultimate++ when I have to use a Visual C++ compiler? Is my Code really platform independed?

Am I really forced to use the VC compiler?

Hello,

do not warry. Your code will be platform indipendent.
Under Linux use gcc. Under windows compile the same source code with VC. It is faster and produces a smaller executable. Unfortunately the mingw and its derivate have some problem. So it make no sense to use them having a free and better alternative.
I regret to have not known it since the first moment.
