A picture of UppCad loaded with a real-life file.... a wooden bridge that will be put on site on this month, originally drawn with AutoCad and imported in UppCad :

The file is quite large, and became even larger from double conversion needed to import in UppCad. Loading time is (debug mode, quite slow) about 2 minutes with rendering time (about double than native autocad) but handling (zooming/panning/rotating) is 3-4 time faster. Notice that ALL constuction details are there, comprising holes in beams, stiff parts, etc.

I'll put a demo version on next days here, for people interested in testing.

I'm also thinking of some sort of partnership to follow development and market it.... involved work is becoming important.

Ciao

Max
