Ok, I see it now I mistakenly thought that you were adding it in to the 'mainconf', but you try to make it work in Add/Remove flags... That is not supported at the moment, but thinking about it, it would be good. It doesn't look trivial to implement, though, so it'll probably take me some time.

Regarding the issue with two flags separated by comma: TheIDE eagerly quotes the string, saving it as flags(WHEN) "FLAG1,FLAG2" If you manually edit it to remove the quotes, like:flags(WHEN) FLAG1,FLAG2 then the code actually works Unfortunately, the code that writes and reads this is used across multiple other options (link flags, uses, targets etc.) where the quoting is necessary. Another issue with this is that the code that saves the additional flags breaks it apart and saves it into two separate lines as soon as you do any changes in the .upp file. So it is probably easier to just add multiple lines... But I'll try to think of some simple way to make it work anyways, perhaps it'll be possible without duplicating too much code.
