Can post?:

Ultimate's U++ "oldest" classes (Value, Date, Time, Nuller, Ref, Sql, OracleSession) started gaining shape in 1998 as a supplement to MS MFC for Oracle GUI applications. At that time already Ultimate's authors were using (and improving) NTL containers as a replacement for STL containers. As Ultimate++ has been constantly expanding since, a lot of older classes (including containers) have been completely rewritten in a quest to become "the most effective C++ set of libraries" from Ultimate's authors points of view.
