Execute me, In the past I had written an app by basic using winsock.ocx, now I want to rewrite it by U++, I have read imgsrv and some examples but I don't understand them. My purpose is set a deamon at port 30785 (optional number). How can I do that with U++? I have read some documents about socket programing by C, but it write for Unix, I can't find any similar header files in U++ or any C compiler in Windows.
