Thanks for the link !

I've created this function:

```
Value WitzUrlEncode(const Vector<Value>& arg, const Renderer *) {  
    if(arg.GetCount() != 1 || !IsString(arg[0]))  
        return String();  
    StringBuffer buf;  
    UrlEncode(buf, String(arg[0]));  
    return Value(buf.Begin());  
}
```

```
INITBLOCK {  
    Compiler::Register("url_encode", WitzUrlEncode);  
}
```

But I get two kind of errors (\$rec.name has valid content) :

\$url_encode(\$rec.name) >>> Internal server error (206,12): missing number

or

\$url_encode(rec.name) >>> *****PANIC: Invalid memory access! Segmentation fault (core dumped)

Probably a bug in U++ !!!

Attached sample to test!
